

Agenix-Eye

AUTONOMOUS AI
FOR A SAFER, SMARTER INDUSTRY

Problem

-  **Safety risks** : falls, collisions, fires, leaks...
-  **Security gaps** : intrusions, theft, unauthorized access
-  **Operational Inefficiencies** : reactive maintenance & waste management
-  **Slow incident response** : alerts require human interpretation before action

Agenix-Eye

An AI-powered industrial surveillance and automation system

Real-Time Environmental Monitoring

- Solar-powered cameras stream video from all critical areas
- 24/7 full-site visibility with eco-friendly design

AI Event Detection – Multi-Agent System

- **Safety Agent** → Detects hazards (fire, smoke, leaks, falls)
- **Security Agent** → Identifies intrusions or suspicious individuals
- **Maintenance Agent** → Monitors machine logs, uses RAG with documentation, detects anomalies/failures
- **CoordinationAgent** → Central brain that coordinates decisions among agents and triggers actions.

Technologies Used

Computer Vision

The Safety Agent analyzes the video feed using a computer vision model to automatically detect physical hazards like falls and spills in real-time.

Large Language Models (LLMs)

An advanced AI model (OpenAI's GPT-3.5-turbo) acts as an expert analyst, translating raw machine data into human-readable assessments and generating actionable recommendations.

Retrieval-Augmented Generation (RAG)

The Maintenance Agent uses a RAG pattern to provide the LLM with specific, internal knowledge (like safety protocols) before it generates a response, ensuring the advice is accurate and relevant to your operations.

N8N

n8n acts as the automation engine that takes the critical alerts generated by the AI and triggers real-world actions across different business applications.

Benefits for Industry

Enhanced Safety

- Early detection of hazards such as fires, leaks, and falls minimizes risk to workers and equipment.
- Real-time alerts allow immediate intervention, preventing accidents from escalating into disasters.

Reduced Downtime and cost

- Maintenance Agent detects anomalies in machine logs before breakdowns occur.
- Preventive actions reduce costly repairs and keep production lines running smoothly.

Sustainable Monitoring

- Solar-powered cameras provide uninterrupted surveillance while lowering energy consumption
- Reduction of both energy expenses and infrastructure costs, all while supporting sustainable industrial practices.
